Rains Help With Drought Conditions

(KLZA) Soaking rain across much of the nation's midsection has helped further alleviate drought in the crop growing states of Iowa, Missouri, Minnesota and Wisconsin. Small portions of Nebraska also saw improvement.

A weekly drought monitor, released Thursday by the National Drought Mitigation Center at the University of Nebraska-Lincoln, showed a few regions missed out from the wet weather, including Texas, where southern counties are in exceptional drought - the driest level possible level.

Eastern Nebraska and the western edge of the state improved. Most of Nebraska remains in extreme drought. Kansas saw little change, remaining in exceptional or extreme drought.

With snow in parts of Nebraska and heavy rain in much of the Midwest, some farmers are now hoping for a dry spell so they can get into fields.
